1 Introduction

An ongoing issue affects CDOM in glider with the FLBBCD sensor deployed from 2022-09-01. In the affected datasets, CDOM values show a temporal decrease. From 2022-12-01, the protective copper plate covering the sensor was removed on all the gliders deployed in Bornholm and Gotland. This resolved the temporal decrease, but some sensors displayed a temporal increase. Investigation is ongoing and data quality remains uncertain. All affected datasets have been flagged. Check the variable `cdom_qc`. The table below (Table 1) shows an updated list of all the mission deployed with a FLBBCD sensor, color-coded by severity. Flag column corresponds to data quality: suspect (3), fail (4), and good (1).

Table 1: Info summary for all the mission deployed with a FLBBCD sensor.

Glider	Mission	Location	Mission Start date	Sensor Serial	Issue description	Flag
SEA044	25	Skagerrak	2020-08-20	5948	A	1
SEA055	16	Bornholm Basin	2020-10-31	5925	A	1
SEA068	27	Eastern Gotland Basin	2022-07-27	7564	B	4
SEA076	8	Bornholm Basin	2022-10-05	7485	B	4
	9	Bornholm Basin	2022-10-20	7485	B	4
	13	Northern Baltic Proper, Eastern Gotland Basin	2023-01-13	7485	D	3
	16	Eastern Gotland Basin, Northern Baltic Proper	2023-04-11	7485	D	3
	17	Western Gotland Basin	2023-06-20	7485	D	3
SEA077	11	Bornholm Basin	2022-09-06	7522	B	4
	12	Bornholm Basin	2022-10-03	7522	B	4
	13	Bornholm Basin	2022-10-12	7522	B	4
	15	Bornholm Basin	2022-11-13	7522	B	4
	17	Bornholm Basin	2022-12-08	7522	C	4
	18	Bornholm Basin	2023-01-10	7522	C	4
	21	Eastern Gotland Basin	2023-03-16	7522	D	3
	22	Eastern Gotland Basin, Northern Baltic Proper	2023-05-16	7522	D	3
SEA078	11	Northern Baltic Proper, Eastern Gotland Basin	2023-03-16	7563	D	3

Table 1: Info summary for all the mission deployed with a FLBBCD sensor. (Continued)

	12	Eastern Gotland Basin	2023-05-16	7563	D	3
SEA079	9	Northern Baltic Proper, Eastern Gotland Basin	2023-02-14	7619	D	3
	11	Eastern Gotland Basin	2023-04-11	7619	D	3
	12	Eastern Gotland Basin, Northern Baltic Proper	2023-06-20	7619	D	3

Legend		Flag
A	Data is good	1
B	Apparent temporal decrease in the intensity of the CDOM signal. Cause unknown.	4
C	Apparent temporal increase in the intensity of the CDOM signal. Cause unknown. In this mission, the protective copper plate over the CDOM sensor was removed.	3
D	Previous deployments with this sensor showed a temporal decrease in CDOM. The copper plate protecting the optics sensor was removed and this issue appears to be resolved in this mission. The issue with the sensor has not yet been identified, further controls are recommended.	4

2 Examples

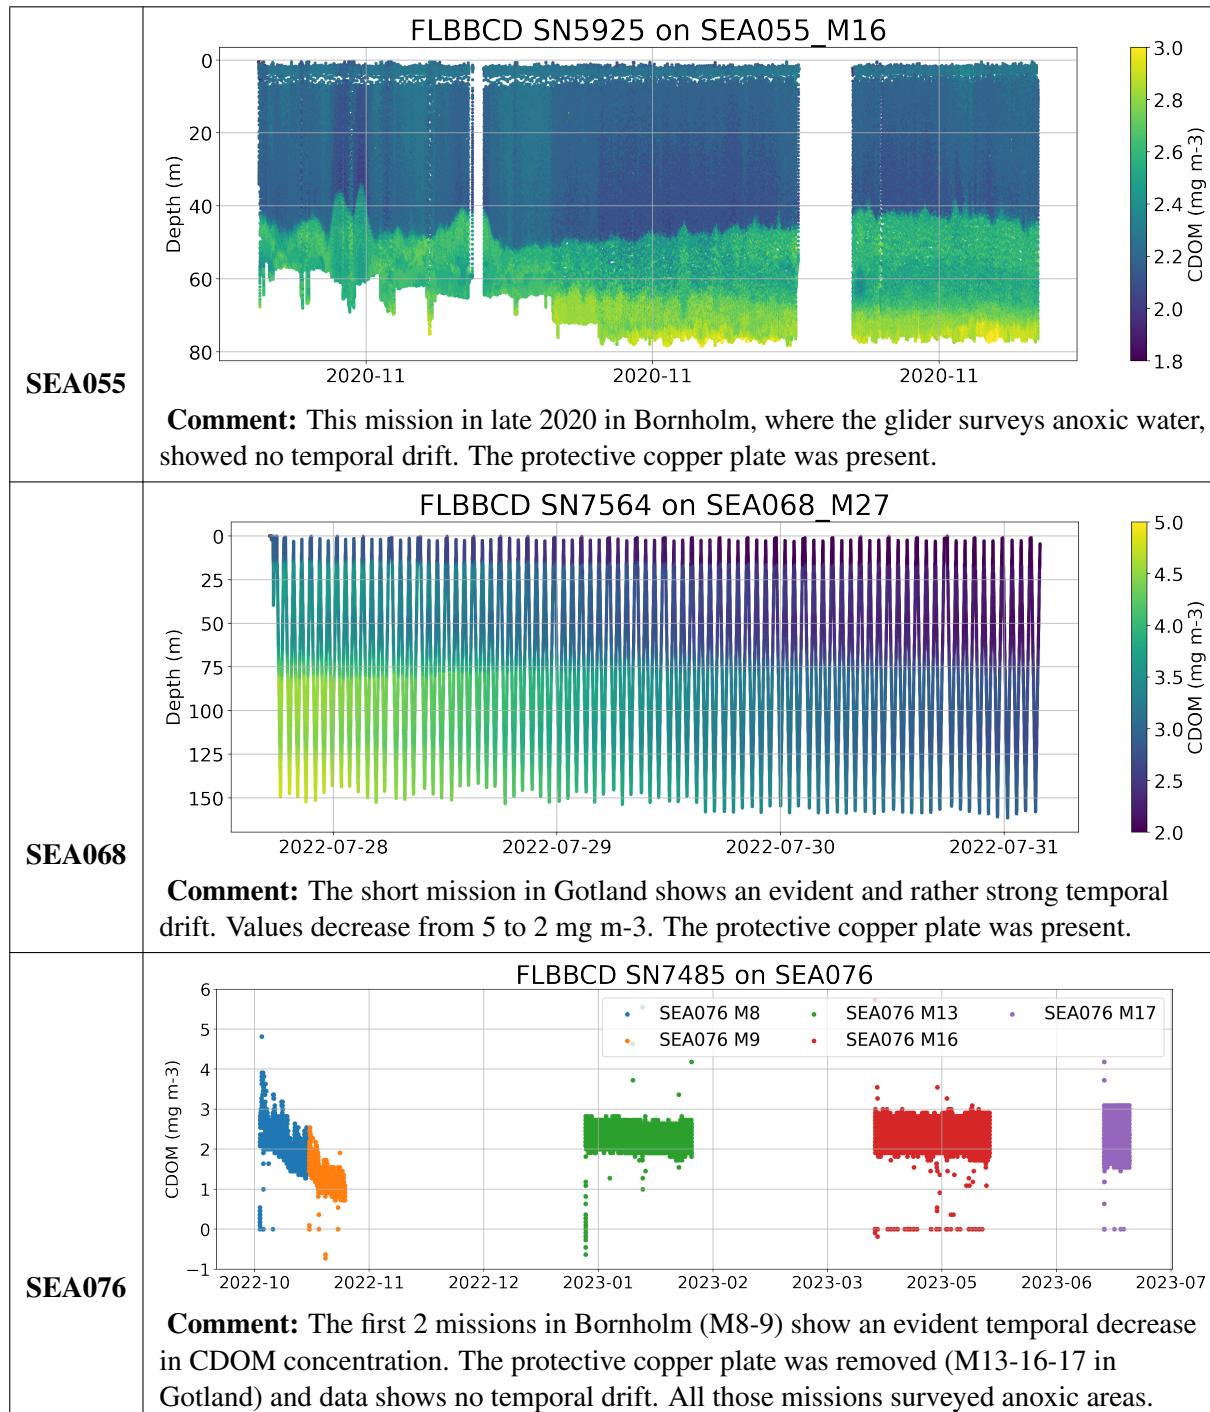

Table 2: CDOM data for each glider to highlight the evolution of the observed issue.

	 <p>Comment: The first 4 missions (M11-12-13-15) show an evident temporal decrease in CDOM concentration. The protective copper plate on the sensor was removed before the start of mission 17 (in purple in Figure 1). The first two missions after the copper plate is removed (mission 17-18) show a temporal increase instead. Finally, the last two missions (21-22) show no temporal drift. All those missions surveyed anoxic areas.</p>
SEA078	 <p>Comment: The protective copper plate was removed before the first deployment. Data never showed a temporal drift. All those missions surveyed anoxic areas.</p>
SEA079	 <p>Comment: The copper plate protecting the sensor was removed before the first deployment of the glider. Data has never showed a temporal drift. All those missions surveyed anoxic areas.</p>
